AN INSTRUMENT FOR INSTITUTIONAL REVIEW

Public value.
Made inspectable.

Follow a commitment through its records. Expose contradictions with their basis. Keep what remains unknown visible.

01 / NORM	02 / RECORD	03 / TRACE	04 / ACTION CHAIN
What is required?	What was filed?	What can be followed?	Who can review?

A shared problem

Procurement, delivery, and payment records can appear plausible individually while their relationships conflict. Review capacity is scarce, and evidence is fragmented across systems.

An inspectable response

SUNLIGHT reads supplied procurement data against explicit rules and jurisdiction calibration. Each reading exposes findings, analytical dimensions, input gaps, and a reproducible content receipt.

> Operational entry point: procurement review. Wider charter: arms, commodities, aid, and documented human need. Each additional category requires its own validated evidence and implementation.

For international relations: reporting obligations and institutional action chains. For economics: transparent measurement and review allocation. For trade: records, counterpart consistency, and traceability across flows.

FICTIONAL RECORD / ACTUAL ENGINE OUTPUT

A direct award.
A visible basis for review.

A synthetic USD 1,000,000 direct award is submitted under the US federal calibration. This page is generated from the API response, not an animated or invented result.

STRUCTURAL READING	EVIDENCE GATE	NORMALIZED FIELDS PRESENT
Concern	Green	13 / 15

PROC-001

Direct award of USD 1,000,000 exceeds competitive threshold (USD 100,000)

Federal Acquisition Regulation (FAR) Part 6 — Competition Requirements; FAR Part 15 — Contracting by Negotiation; FAR Part 13 — Simplified Acquisition Procedures

> A structural concern and a green evidence gate answer different questions. Neither establishes wrongdoing. A green gate does not certify integrity.

Input limitations travel with the result

Missing normalized fields: country_code, country_name. Presence is not truth; defaults can count as present and the v1 heuristic treats numeric zero as missing.

The reading can be checked

The accompanying JSON packet carries the request, response, calibration hashes, Python source manifest, and runtime versions. Use the offline verifier to check content equality. Hashes are not signatures or source authentication.

A BOUNDED PILOT WITH MEASURABLE ACCEPTANCE

From a finding to accountable review.

1. **Agree the question.** Select an institution-approved dataset, jurisdiction, review team, and acceptance criteria.
2. **Validate the mapping.** Check that supplied source fields reach the analytical dossier and that missing evidence stays unknown.
3. **Compare the review process.** Measure coverage, false positives, unassessable cases, workload, and reviewer dispositions against the institution's existing process.
4. **Establish the controls.** Approve access, retention, corrections, disclosure, independent security review, and named action owners.
5. **Verify the handoff.** Track acknowledgement, review, disposition, and any authorized action. Operational benefit needs observed evidence.

> SUNLIGHT has no authority to freeze, recover, redirect, or disburse funds. Those capabilities require separate mandates and operational integrations.

Evidence before adoption claims.

Historical metrics belong to their exact corpus and sampling protocol. The complete reference database is required to reproduce the published floor. A synthetic demonstration, a green test suite, and field effectiveness are different forms of evidence.
